

PALAX Packer 35

**A handy way to pack the firewood
Easy to store and transport**

Put firewood into the measuring box. A suitable length of firewood is about 32,5 cm. Do not pile the firewood

As soon as the box fills up, pull the bag over completely..

Swing the bag to the ground. Hold it tightly to ensure it comes down smoothly and to prevent the firewood from packing in the bottom of the bag

Full bag, about 35 - 38 litres.

The bags may be placed onto a pallet.

In the picture, the bags are placed onto a FIN-pallet, 6 bags in a layer and 5 layers one on top of the other.

The height of the pile of bags is about 100 cm and the length is about 120 cm; a pallet takes about 1,1 stacked cubic metres.

Packing 30 bags and piling them onto the pallet takes at maximum 1 hour and it is possible to speed up the work considerably by positioning the firewood at a suitable height for easy handling.

The bags are made of UV-protected polypropylene.

They withstand the UV-radiation from the sun and may be reused several times.

The bags can be disposed of even by burning..
